

# CathRAD®

The Software for Predicting & Optimizing  
Marker Band Visibility

Roth Technologies, LLC

# CathRAD® Software

- Fundamentals for CathRAD® Software
  - X-Ray Absorption
  - Exponential Attenuation Law
  - Marker Band Designs
- Radiopacity Index
- Standard Material Library
- CathRAD® Example
- MicroSoft Excel Integration
- Validation
- CathRAD® Software Use
- Contact Information

# X-Ray Absorption

- Ability of a material to attenuate an X-Ray beam depends on the following factors:
  - Marker Band Geometry
  - Marker Band Thickness
  - Material
  - X-Ray Energy
- Actual Contrast also depends on the following:
  - Anatomical region being visualized
  - Patient Size

# Exponential Attenuation Law

- A narrow beam of monoenergetic photons penetrating a layer of material is modeled by the Exponential Attenuation Law:

$$I = I_0 \exp[-\mu L]$$

- $I_0$  = Incident Intensity
- $I$  = Emerging Intensity
- $L$  = Material thickness
- $\mu$  = Attenuation Coefficient

# Marker Band Geometry

- The Geometry of a Marker Band may be fully described by the following items:
  - Inner Diameter (ID)
  - Outer Diameter (OD)
  - Wall Thickness
  - Length
- CathRAD® allows a marker band geometry to be described dimensionally as follows:
  - ID/OD (Wall reference only)
  - ID/Wall (OD reference)
  - OD/Wall (ID reference)

# Radiopacity Index

- CathRAD® computes a RP Index for a specific Marker Band Dimension and Material
- RP Index is a function of the following factors:
  - Marker Band Material
  - Marker Band Thickness
  - Marker Band Geometry (OD and Length)
- RP Index is a direct indication of Radiopacity
  - RP Index=20 is twice as visible as RP Index=10
- Monte Carlo Simulation
  - Tolerances can result in wide RP Index ranges
  - CathRAD® includes a Monte Carlo simulation engine in the software
  - CathRAD® computes the expected RP Index Mean, Standard Deviation, Min, and Max RP Index for a given marker band design based on the marker band tolerances

# Standard Material Library

- CathRAD® comes with a Standard Material Library
  - Platinum and Platinum/Iridium
  - Gold (24K and 18K)
  - Tungsten
  - Nickel
  - Silver
  - Stainless Steel
  - Radiopaque Polymer Formulations ( $\text{BaSO}_4$ ,  $\text{Bi}_2\text{O}_3$ ,  $\text{Bi}_2\text{O}_2\text{CO}_3$ )
- The CathRAD® Standard Material Library is Dynamic
  - New Materials and Composites Materials can be loaded without recompiling the program
  - The Standard Material Library can be customized for your company

# CathRAD® EXAMPLE

- Enter the Specification
- Enter the Material
- Enter Material Loading
- Enter the MB Geometry
- Select Compute button
- View the numerical outputs for your design
- Export to Microsoft Excel

# MicroSoft Excel Integration

The Monte Carlo Simulation results from CathRAD® are summarized in a Histogram

# Software Validation

The CathRAD® Software has been developed and subjected to a Written Software Validation.

A summary of this Validation Report is available on our website ([www.cathrad.com](http://www.cathrad.com))

# CathRAD® Software Use

- Engineering: Optimize New Product Designs
  - Understand marker band visibility as a function of material, dimensions, and tolerances
  - Optimize Cost vs. Marker Band Visibility
- Manufacturing Operations
  - Evaluate “off the shelf” marker band parts in situations where you run out of parts or quality issues
- Existing Products – Cost Savings
  - 2013.05.31: Platinum was \$1,450/oz, Gold was \$1,387/oz
  - Software may be utilize to evaluate alternate marker band materials and/or optimize current designs to save \$
